Abstract

Due to the situation of our country's need for fuel, energy requirement has become a major problem due to the over pricing of the fossil fuels like coal, petrol, diesel, etc. So it is very much important to find an alternative source of fuel to satisfy the need of our countries fuel requirement. This work is based on those factors. The capability of biogas in power generation is substantial and is definitely a field that deserves a lot of awareness. This work has fully described the method of production and uses of biogas. It has also gone a step further to filter and remove the traces of H_2S gas from the raw biogas. Food wastes are gathered and prepared for anaerobic digestion, and the biogas created is tested experimentally for its ability to operate a boiler and used that energy to make electric power. According to experimental findings, adding 2% of food waste could significantly increase the volume of CH_4 gas. As the biogas is prepared from organic waste, its price is very much lower than
